

## Here's how it works:

An electric vehicle can go about 200km on a full charge.

1

The driver charges at home & reaches **60%** ⚡

2

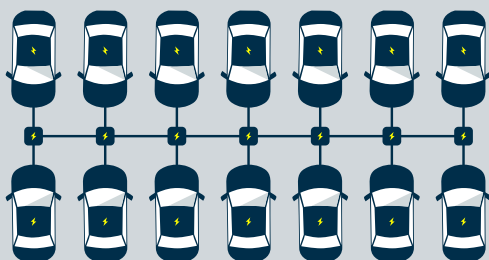

He drives to work 40 km away, battery life goes down to **40%**

He then charges at work & reaches **70%** ⚡

3

After work, he drives 100km to Mom's & is down to **20%**

So he stops to charge at a gas station and reaches **30%** ⚡

4

While at his mom's, he charges overnight at a local charging hub & reaches **100%** before his 140 km drive back home ⚡
